safety and efficiency are The trigeneration plant desiamong the main strengths of gned and built by AB Energy, the Coca-Cola HBC facility at with an installed power of Oricola (L'Aquila, Italy), which 3MW, has made it possible to provides jobs to people from further increase the energy an area covering the whole of efficiency of the production

CONTOURGLOBAL

As an independent power producer, ContourGlobal has an installed capacity of over 3GW in North and South America, Europe, Guadeloupe, Saint Martin and Africa. Since it was founded in 2005, CountorGlobal is offering clean and reliable energy generation in all of the plants. ContourGlobal was praised by president Obama for its contribution to the energy sector in Africa, to enable faster sustainable growth in the continent. A major element in CountorGlobal's decision to turn to AB Energy was its desire to find a real partner able to provide turnkey cogeneration solutions. Its decision proved to be wise as the Coca-Cola HBC plant in Oricola was built within the set budget and on-time.

FOR THE COCA-COLA HBC OF ORICOLA (L'AQUILA, ITALY

One of the key strategic projects of Coca-Cola HBC is the target of sustainable growth. ContourGlobal Coca-Cola HBC's bottling facilities.

province of L'Aquila (Italy), is particularly significant the objective of reducing emissions and energy Ecomax® 30 plant built by AB Energy.

modular solution and supplies the bottling facility on stakeholders.

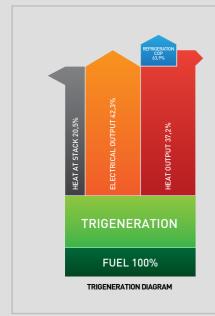

with electricity, steam at 8 bar and hot water at high temperature (95°C), which is used by the absorption together with Coca-Cola HBC are achieving this chiller to produce chilled water. The cooling energy goal by implementing TriGen and QuadGen plants in obtained by means of trigeneration is also used in the various stages of the production cycle, especially The example of the Oricola bottling facility, in the to store the beverage bases of syrup, by now famous throughout the world, at a controlled temperature. as it demonstrates how technological decisions. Among the results obtained by switching from aimed at upgrading efficiency are combined with traditional boilers to a cutting-edge TriGen plant, besides the reduction in energy production costs consumption levels. This was achieved by the TriGen and improved overall management of thermal energy, there are also substantial reductions in AB and ContourGlobal engineers proposed as the water consumption, a lower environmental impact best configuration for Oricola, a full-load rate capacity and less noise inside the production facility, to the of 3,041 electrical kW and a cogeneration thermal benefit of workers; yet a further indication of AB, capacity of 2,677 kW. The plant is housed in a outdoor Contour Global and Coca-Cola HBC's constant focus

The Ecomax® modular cogeneration plant is unique in terms of design and production capacity, the result of Gruppo AB applied research. Ecomax® is an industrial product based on versatility, modularity and compactness, able to combine these distinctive features with high energy performance. An idea conceived and developed entirely by AB, offering numerous application options and setting the standards for modern cogeneration in terms of technology and market.

Tie-ins completion (process water/steam/boiler supply water/raw water/hot water/cooled water)											
Power connections on site											
Mechanical installation, engine testing and start up											
Delivery of main plant components											

For the needs of the Coca-Cola HBC facility in Oricola, Gruppo AB and ContourGlobal specialists suggested adopting Ecomax® 30 in a configuration developed for the specific requirements of the facility and which integrates perfectly with the already-existing plants, particularly as regards the use of thermal energy.

TRIGENERATION

Trigeneration is the production of electricity, heat and cooling in one process. Basically, a trigeneration power plant is a cogeneration power plant that has added absorption chillers for producing chilled water from the heat that would have been wasted from a cogeneration power plant. In addition to the economic benefits and advantages, trigeneration plants help our environment by dramatically reducing greenhouse gas emissions - such as carbon dioxide - when compared to typical power plants. Trigeneration plants are very energy efficient, conserve natural resources and reduce fuel consumption as the system operates at such high efficiencies. Cogeneration and trigeneration power plants are about 90% efficient and approximately 300% more efficient than "central power plants" which average at 27% to 40% efficiency. When fueled with renewable fuel, cogeneration and trigeneration plants are carbon neutral, producing no greenhouse gas emissions and the optimum solution for clients seeking to reduce their energy expenses and greenhouse gas emissions.

Why did ContourGlobal choose cogeneration? What is the real benefit of a cogeneration plant in the beverage industry?

As an energy production company that uses state-of-the-art technologies and equipment, we strongly believe in energy efficiency and emissions reduction. Optimizing consumption and environmental impact not only benefits our clients but also remains in line with our sustainability plan. In compliance with these principles, ContourGlobal has teamed up with Coca-Cola HBC for the construction of QuadGen and TriGen plants within Coca-Cola HBC's bottling facilities in Europe and Africa. Coca-Cola HBC's production environment, in which electrical and thermal energy are used, is an ideal environment for QuadGen applications.

How come you called in AB to build the plant?

This cooperation resulted from AB's know-how and expertise in the cogeneration market both on a plant installed basis and service level. We carefully assessed the type of plants designed and made by AB, considering them ideal for the requirements of the beverage industry and of the Coca-Cola HBC facilities in particular. We were in fact seeking easy-to-install package plants. Equally important so far as we were concerned was to have a precisely-

defined plan, whereby interlinking with the production process of the Oricola facility would be rational and reduce production stops to the utmost. From our first contacts with them, we found AB Energy highly professional and capable of understanding and designing our requirements for the Oricola plant. The feasibility plan presented by the AB engineering department was up to our expectations, and their capabilities satisfied our concept for a turnkey solution.

How does the cogeneration plant built by AB integrate with the plant engineering conditions of the Oricola facility and what are the existing energy dynamics?

Coca-Cola HBC has a number of plants in Italy and has developed a specific program aimed at more efficient energy production systems with low environmental impact. The cogeneration plant installed at the Oricola bottling facility successfully meets the electrical and thermal energy targets required.

Have you managed to determine effectiveness with respect to the expected benefit?

The benefits are clear. A low efficiency gas-fired boiler and mechanical chillers have been replaced in the latest TriGen technology, significantly increasing efficiency and reducing costs.

AB INDUSTRIAL GROUP HAS 30 YEARS IN THE SECTOR **OF COGENERATION AND PROMOTION OF ENERGY** FROM RENEWABLE SOURCES.

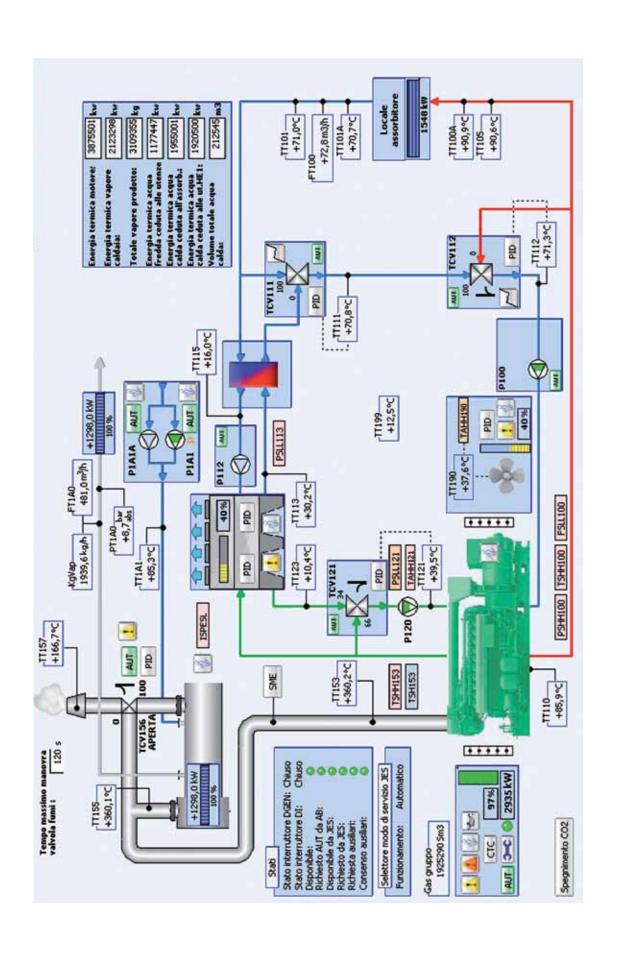

of an absolutely unique engineering and Canada.

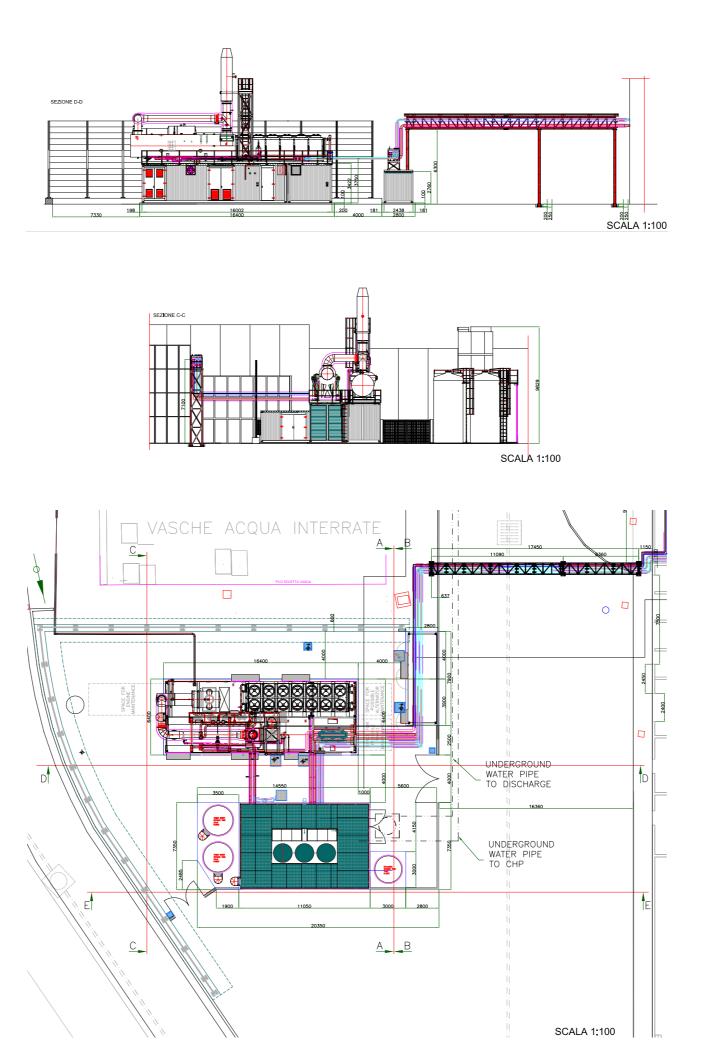

BEEN OPERATING FOR OVER AB is currently made up of 16 companies department: a team of over 100 and over 500 employees and is a engineers engaged in developing the single entity able to manage the entire industry towards the production of manufacturing cycle of a cogeneration increasingly more reliable and higher plant: consultancy, design, production, performance plants. AB cogeneration installation and start-up with a plants are distinguished by modularity, comprehensive service. This has compactness and ease of transport enabled AB to acquire unparalleled and cater to the energy requirements know-how, to become acquainted with of a number of different companies. every product detail and to provide a Outright leader in Italy, AB is also top-quality and highly-effective after- expanding globally: in Spain (2007), sales service. The success of AB - in Romania (2009), in Poland with the which has already designed and built acquisition of the majority share of more than 800 plants - stems from KWE Technika Energetyczna (2010), and ongoing investments in cutting-edge again with the opening of subsidiaries technologies, from the constant training in Croatia and Serbia (2011). From 2012 and professional specialisation of all AB is in Czech republic and from 2013 operators and from the development also in the Netherlands, Austria, Brazil
